

# Bash Scripting Cheat Sheet

© Erik E. Lorenz, May 23, 2014

## Internal Files and Directories

<code>~/.bashrc</code>	user-specific constants. Sourced when bash starts
<code>~/.bash_profile</code>	similar to <code>~/.bashrc</code>
<code>~/.bash_history</code>	list of previous bash commands
<code>~/.bash_logout</code>	sourced on bash logout
<code>/bin/bash</code>	location of the bash executable

## Terms

term	description	examples
<i>user</i>	a user account of the system	root e.lorenz
<i>file</i>	regular file	<code>~/file.txt</code> <code>code/asd/src/main.cpp</code>
<i>dir</i>	regular directory	<code>~/directory</code> <code>/etc</code>
<i>cmd</i>	any command	<code>echo</code> <code>date</code>
<i>host</i>	url or ip of a remote machine	<code>enssim.etit.tu-chemnitz.de</code> <code>134.109.52.89</code>
<i>port</i>	a network port for interaction with a specific program	<code>22</code> <code>31159</code>
<i>url</i>	fully qualified url	<code>http://host:port/dir/file</code>
<i>pid</i>	process id	<code>18738</code>
<i>alias</i>	command alias	<code>alias ssk='ssh enssim'</code>
<i>export</i>	define an environment variable	<code>export PATH=~:/bin:\$PATH</code>
<i>source</i>	read a script in the current bash instance, e.g. for exporting	<code>./ ~/.bashrc</code> <code>source ~/.bashrc</code>

## Useful Environment Variables

<code>\$HOME</code>	home directory. Usually <code>/home/user</code>
<code>~</code>	same as <code>\$HOME</code>
<code>\$USER</code>	name of the current <i>user</i>
<code>\$EUID, \$UID</code>	(effective) user id
<code>\$PATH</code>	colon-separated list of search directories for binaries
<code>\$LIBRARY_PATH</code>	search paths for .so and .a files at compile time
<code>\$LD_LIBRARY_PATH</code>	search paths for .so and .a files at run time
<code>\$PWD</code>	current working directory
<code>\$EDITOR</code>	preferred command line text editor, e.g. vim
<code>\$IFS</code>	internal field separator, e.g. for <code>for...in</code> constructs
<code>\$LINENO</code>	current line number in a script, e.g. for debugging
<code>\$COLUMNS</code>	width of the terminal
<code>\$LINES</code>	height of the terminal
<code>\$LANG</code>	preferred language of the user
<code>\$SHELL</code>	path of the shell-executable. Should be <code>/bin/bash</code>
<code>\$SHLVL</code>	shell nesting level on the current machine
<code>\$\$</code>	<i>pid</i> of the current script or bash instance
<code>\$PPID</code>	<i>pid</i> of the parent process
<code>\$!</code>	<i>pid</i> of the last child process (see <a href="#">Forking</a> )
<code>!!</code>	previous command
<code>!\$</code>	last argument of the previous command
<code>!~</code>	first arguments of the previous command
<code>!:1, !:2, ...</code>	arguments of the last command
<code>!:1-</code>	all arguments of the last command
<code>\$@</code>	array of arguments to a script or function
<code>\$0</code>	command used to run this script or bash instance
<code>\$1, \$2, ... \$9</code>	first, second, ... ninth argument

## Cheat Sheet Color Coding

<code>cmd</code>	Most frequent commands
<code>cmd</code>	Usually not harmful
<code>cmd</code>	deletes data or annoys others. May require root permissions

## Debugging

<code>set -x</code>	print every command which is executed
<code>trap read debug</code>	confirm every command with [Enter]

## Hotkeys

Tab	autocomplete the current command or path
Ctrl+I	same as Tab
Alt+*	insert all possible completions
Ctrl+C	kill the current command
Ctrl+D	exit the current shell
Ctrl+X Ctrl+E	write the next command in your \$EDITOR
Ctrl+R	reverse-search your history for a command
Ctrl+Z	suspend the process. Resume with %
Ctrl+L	clear the terminal. Similar to <code>clear</code>
Ctrl+U	clear the line before the cursor
Ctrl+K	clear the line after the cursor
Alt+F	move forward one word
Alt+B	move backward one word
Alt+D	delete next word
Alt+Backspace	delete previous word

## Redirecting Standard I/O

<code>cmd &gt; file</code>	write output to a new <i>file</i>
<code>cmd   tee file</code>	both print and write to a file
<code>cmd &gt;&gt; file</code>	append output to <i>file</i>
<code>cmd 2&gt; file</code>	write errors to <i>file</i>
<code>cmd 2&gt;&amp;1</code>	redirect errors to standard output
<code>cmd &amp;&gt;/dev/null</code>	discard all output
<code>cmd &lt; file</code>	read input from <i>file</i>
<code>cmd &lt;&lt; EOF</code>	read input from command line until word "EOF"
<code>cmd &lt;&lt;&lt; cmd</code>	read input from the rest of the line
<code>cmd   cmd</code>	redirect output from the first to the second <i>cmd</i>

## Child Processes and Forking

<code>cmd &amp;</code> <code>(cmd &amp;); exit</code>	run <i>cmd</i> in the background as a child process (fork) run <i>cmd</i> in the background and exit
<code>set -m</code> <code>trap func CHLD</code> <code>wait</code>	run <i>func</i> when a child exits wait for all child processes to exit

## Automatic String Expansion

<code>bash*</code>	<code>.bash_history</code> <code>.bash_logout</code> <code>.bash_profile</code> <code>.bashrc</code>
<code>bash_???????</code>	<code>.bash_history</code> <code>.bash_profile</code>
<code>{7..11}</code>	<code>7 8 9 10 11</code>
<code>{07..11}</code>	<code>07 08 09 10 11</code>
<code>{a..g}</code>	<code>a b c d e f g</code>
<code>sim{08..10}</code>	<code>sim08 sim09 sim10</code>

## Conditions

<code>if expression; then</code> <code>do something</code>	typical if statement. Expressions can be commands and functions (return 0 → true) or built-in conditional expressions, see below
<code>else</code> <code>do something else</code>	
<code>fi</code>	
<code>expression &amp;&amp; cmd</code>	run <i>cmd</i> if <i>expression</i> is true
<code>expression    cmd</code>	run <i>cmd</i> if <i>expression</i> is false

## Unary Expressions

<code>[ -z str ]</code>	<i>str</i> is empty	<code>[ -n str ]</code>	<i>str</i> is not empty
<code>[ -e file ]</code>	<i>file</i> exists	<code>[ -s file ]</code>	<i>file</i> is not empty
<code>[ -f file ]</code>	<i>file</i> is a regular file	<code>[ -d dir ]</code>	<i>dir</i> is a directory
<code>[ -L file ]</code>	<i>file</i> is a symlink	<code>[ -x file ]</code>	<i>file</i> is executable
<code>[ -r file ]</code>	<i>file</i> is readable	<code>[ -w file ]</code>	<i>file</i> is writable
<code>[ -v str ]</code>	<i>str</i> is a variable	<code>[ -0 file ]</code>	<code>\$USER</code> owns <i>file</i>

## Comparison Expressions

<code>[ arg1 &lt; arg2 ]</code> <code>[ arg1 &gt; arg2 ]</code> <code>[ arg1 == arg2 ]</code> <code>[ arg1 != arg2 ]</code>	strings	<code>[[ arg1 &lt; arg2 ]]</code> <code>[[ arg1 &gt; arg2 ]]</code> <code>[[ arg1 == arg2 ]]</code> <code>[[ arg1 != arg2 ]]</code>	raw strings
<code>[ arg1 -lt arg2 ]</code> <code>[ arg1 -gt arg2 ]</code> <code>[ arg1 -eq arg2 ]</code> <code>[ arg1 -ne arg2 ]</code>		<code>(( arg1 &lt; arg2 ))</code> <code>(( arg1 &gt; arg2 ))</code> <code>(( arg1 == arg2 ))</code> <code>(( arg1 != arg2 ))</code>	
	integers		integers

## Loops

<code>for word in \$words; do</code> <code>echo \$word</code> <code>done</code>	print every word in \$words
<code>while expression; do</code> <code>do something</code> <code>done</code>	traditional while loop
Two ways of iterating from 0 to 9:	
<code>for i in {0..9}; do echo \$i; done</code>	
<code>i=0; while (( num &lt; 10 )); do echo \$i; let i++; done</code>	iterate over every line in \$var:
<code>IFS=\$'\r\n'; for line in \$var; do echo \$line; done</code>	

## Parallel Workers

<code>num=100</code> <code>next(){</code> <code>(( num &gt; 0 )) &amp;&amp; let num--    return</code> <code>cmd&amp;</code> <code>}</code> <code>set -o monitor</code> <code>trap next CHLD</code> <code>for i in `grep proc /proc/cpuinfo`;do</code> <code>next</code> <code>done wait</code> <code>trap - CHLD</code>	Run <i>cmd</i> 100 times in parallel, one process per cpu core
--	--

## I/O Processing

<code>echo \$@</code> <code>while true; do</code> <code>echo "\$1"</code> <code>shift    break</code> <code>done</code>	process all arguments at once  print every single argument on its own. To be used in a script or a function.
<code>ls   xargs</code> <code>echo "foo bar"   xargs -n1</code> <code>echo "foo bar"   xargs -n1 cmd</code>	merge all output lines split to one word per line run <i>cmd</i> on every single word
<code>read myvar</code>	read a line from stdin into \$myvar

## Bash invocation

<code>bash -c "cmd"</code>	run <i>cmd</i> in a fresh bash instance
----------------------------	---
